Machinery Standards for Safe & Strong Farms

Development and publication of standards, especially those that are integrated into machinery design have a positive impact on reducing risk of harm to operators and bystanders.

Continued active participation in standards development activities benefits those engaged in Canadian production agriculture by providing information on best design practices for reducing risk of exposure of harm for operators of agricultural machinery.

Research, accumulated and documented over time, has indicated that application of standards in the design of production agricultural machinery has made a significant positive impact on reducing risk of harm to operators.
